

IRELAND

Rating Analysis - 11/29/10

Debt: EUR104.6B, Cash: EUR28.1B

EJR Sen Rating(Curr/Prj) BB+/ N/A

EJR CP Rating: A3

EJR's 1 yr. Default Probability: 2.7%

Look for debt forgiveness - The EU and IMF have agreed to an €85B aid package for Ireland which may be drawn upon over the course of seven and a half years. Dublin will contribute €17.5B while the IMF will contribute €22.5B and Europe will provide €45B. Bilateral loans will be provided by the UK (€3.8B), Sweden (€0.6B) and Denmark (€0.4B). About €50B will be put towards aiding Ireland's public finances while the remaining €35B has been set aside for the banks (€10B towards recapitalization and €25B towards emergency contingency fund for the banking system). An average interest rate of 5.8% will vary upon different parts of the package. After the latest bailout, Ireland has €400B of guarantees (courtesy of its banking sector) and EJR expects Ireland will have €220B of debt, totaling €620B which equates to €135K per person (€48K for debt alone) compared to €23K in debt per capita for France.

The annual interest cost for €300B of debt (i.e. €220B as of the end of 2010 plus our assumed €80B from the €400B of guaranteed bank deposits) at 6% equates to €18B or 60% of Ireland's tax revenues. The austerity measures are more or less irrelevant but are likely to create Irish discontent. A large portion of the current debt package is likely to be forgiven by 2013. We are affirming at "BB+" but expect a debt restructuring over the next couple of years.

Sluggish Economic Recovery

For fifteen years, the highly industrialized Celtic Tiger economy consistently outperformed the rest of the eurozone. However, growth began to decline in 2007, and by 2008 Ireland became the first eurozone country to enter into recession. After eight consecutive quarters of economic contraction, the country officially emerged from recession in the first quarter of 2010.

Ireland's Central Statistics Office reported an increase in GDP of 2.2% (seasonally adjusted) during the first quarter of 2010 and a decrease in GNP of 1.2%. By Q2 2010, estimates showed a seasonally adjusted decrease of 1.2% in GDP and a slightly lesser decrease of 0.3% in GNP. Net exports were €884 million higher during the quarter compared with the year prior. Overall, the decrease in GDP growth during the most recent quarter was due in large part to consumer spending and capital investment. While consumer spending was down 1.7% in the quarter over the year prior, capital investment declined by 19.9%.

Along with Greece, Ireland is one of the fiscally weakest countries in the euro-zone. Its debt-to-GDP ratio is currently 77.4%. Meanwhile, Ireland's deficit-to-GDP ratio is currently the highest in the EU at 14.30%. The deficit is expected to rise considerably in the months ahead as the government prepares to spend as much as €50 billion to repair the country's troubled banking sector.

Low Inflation

Inflation has remained relatively low in Ireland. After having averaged 3.0% between 2006 and 2008, the economy entered into a deflationary cycle in 2009. The IMF has warned that the country could see continued deflation into 2011, predicting that prices will decline 1.8% this year and a further 0.5% thereafter. The likelihood of deflation is due to a number of factors including slowed economic growth, equity prices, housing prices, the real exchange rate, credit growth, and monetary aggregates.

In the most recent month, consumer prices increased 0.7% over the month prior and 0.2% YoY. The main factors which contributed to the monthly change included Clothing & Footwear (+3.7%), Housing, Water, Electricity, Gas & Other Fuels (+3.5%), and Transport (+0.5%).

High Unemployment

Unemployment levels fell for the second month in a row in October 2010, down 0.1% to 13.6%. This rate compares to the average 13.2% unemployment seen in Q2 2010. The rate is currently one of the highest in the EU. Finance Minister Brian Lenihan expects levels to peak within the next few months before declining thereafter. Although the rates are not yet as high as the country's 18% levels seen during the late 1980's, unemployment is more than three times greater than the roughly 4.5% rate seen right before the economic crisis began. Rising levels have been credited in large part to government cutbacks.

Banking Troubles

Ireland currently faces massive budget deficits after having bailed out its troubled banks. To date, the government has injected roughly €22 billion in capital into the banks, as reported by the IMF. In early 2009, the country nationalized the Anglo Irish bank. Furthermore, both Bank of Ireland and Allied Irish Bank (the country's two largest banks) have received capital injections. Ireland currently holds a 25% stake in Bank of Ireland. Costs of continued bailout funds could soon exceed 30% of GDP. The continually rising costs have exceeded estimates and continue to raise investor concern.

Irish Government Bonds

The yield premium to hold Irish government bonds over the benchmark German bunds has reached record highs in recent weeks. Downgrades from other agencies, as well as speculation and fear pertaining to the mounting costs of rescuing the country's banking sector (namely the nationalized Allied Irish Bank) have contributed to the increases. Investors are likely to continue demanding higher premiums to hold Irish debt in the months ahead.

Meanwhile, the costs of insuring Irish government debt against default have also risen to record highs. The spread on 5 year Irish CDS's reached levels of 490 bps in late September. All this comes as investors remains uncertain of Ireland's fiscal stability.

Economic Freedom & Business Environment

Ireland currently constitutes the freest economy in Europe and the fifth freest in the world as measured by the Heritage Foundation's '2010 Index of Economic Freedom'. The country's score decreased by 0.9 point from the year prior. While the recent economic crisis has severely damaged the country's banking sector and destabilized the country's fiscal budget, Ireland's institutions have remained strong. Low levels of corruption, efficient business regulations and competitive tax rates have all helped to keep Ireland's overall levels of economic freedom internationally competitive.

Attracting Foreign Direct Investment

Ireland has long welcomed foreign direct investment, as indicated by its near perfect and growing Heritage Foundation 'Investment Freedom' score of 95 out of 100 (see previous page). The country's young age demographics have helped to attract large inflows of FDI. Ireland has the youngest population in Europe with 33.9% under the age of 25 years. Furthermore, the country offers a very business friendly environment. As indicated via the latest World Bank 'Doing Business' survey, Ireland allows for relative ease in all aspects of owning and operating a business in the country. Domestic and foreign firms are incorporated and receive equal treatment, and there is no approval process for foreign investment or capital inflows unless the company is applying for incentives (2010 Index of Economic Freedom).

Lastly, businesses are attracted to Ireland's relatively low corporate tax rates. The country's growth during its 'Celtic Tiger' years has been credited in large part to this factor. The top corporate tax rate is 12.5%. The average corporate tax rate in the EU is 23%. Overall, tax revenue as a percentage of GDP in Ireland was 32.5% in 2009.

Trade

Exports increased by 8% (seasonally adjusted) in July over June while imports fell by 0.9%. As a result, Ireland's trade surplus increased 29% to €4,202.5m. In August 2010, Ireland's trade surplus totaled just over €27.8 billion year-to-date. The country's trade surplus in the first eight months of 2009 totaled €26 billion. Ireland currently relies heavily on exports for meeting economic growth targets.

Austerity Measures

On November 21, 2010, Ireland accepted a bailout from the EU/IMF with contributions from the UK and Sweden. Negotiations of terms are underway and are expected to be finalized by the end of the month. The bailout is expected to total €80-90bn euros. Irish officials are working to implement an effective deficit-reduction strategy as the country's deficit is currently among the highest in the 27 member EU block. The government plans to reduce its deficit below 3% of GDP by 2014. We believe this is an ambitious goal. To date, the government has cut public sector wages by 10-15% and has pledged to refrain from further cuts until 2014. Still, the government has forecast the need to cut spending by a minimum of €3 billion (US\$4.13 billion) in its upcoming 2011 budget. Further cuts in pensions and welfare are currently under consideration as a means of reduction. Moreover, the government is coming under increased pressure from fellow EU member states, particularly France and Germany, to raise its corporate tax rate. At 12.5%, the rate is well below the EU average and among the lowest in the EU. Many European nations view the low rate as an unfair advantage for Ireland and argue that a rate increase would not hinder economic growth.

Sovereign Rating Methodology

Egan-Jones takes the perspective of the investor as its primary point of view when developing the ratings it issues for sovereigns. Therefore, in the case of sovereign ratings, we attempt to take a more holistic view of credit quality to include not only analytic comparisons of various sovereign issuers but also the impact on our quantitative and qualitative analyses by current global, sovereign, governmental and market events, including the effects of government investments in speculative, volatile or other high risk investment products. For example, many sovereign issuers have taken on significant exposures of major financial institutions over the past several years. Hence, we calculate the under-funding of financial institutions and include this amount in the total indebtedness of sovereigns. (We use a base assumption that no country can afford to allow its major banks to fail and therefore we believe that there will almost always be an intervention by either a host or allied nation should financial institutions or markets require support at some measurable level.)

Generally we devise modeling calculators and do an analysis that examines the debt load of a country with respect to its GDP and other economic indicators. The analysis is then adjusted to reflect the outlook on a myriad of factors that reflect the firm's overall view of the sovereign debt and the quality of the country's ability to meet and thrive under such load. Some of the qualitative factors that impact our ultimate assessment of credit quality such as the flexibility, stability and overall strength of the economy, ease of tax collection, acceptance of contract law, ease of doing business, and prospects for future growth and health. The non quant issues are generally subjective and a moving target, so each rating of a sovereign may differ because of the non-quantitative nuances being addressed.

Nota Bene

History has proven that defaults on domestic public debt do occur. In fact, seventy out of three hundred twenty defaults since 1800 have been on domestic public debt (1). Egan-Jones does not view a country's ability to print its own currency as a guarantee against default. Additionally, Egan-Jones generally views cases of excessive currency devaluation as a de facto default.
